                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .
                                                                                                                                                                                             together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: EMBL: Sw:, SWISSPROT: IT:, TREMBL: Wp:, WORNPEP: Information on the WORNPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                             http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence is the entire insert of clone 1112b6. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key.
This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 whitp://www.sanger.ac.uk/HGP/Chr6
                                                Submitted (09-SEP-1999) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Sep 6, 1999 this sequence version replaced gi:5791529.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1112D6 is from the library RPCI-5 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          several contigs from automated sequence assembly concatenated together. No attempt has been made to order or orient the contigs relative to one another correctly before concatenating. At each location in the sequence where contigs have been joined, several consecutive Ns.may have been inserted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AC010886 190094 bp DNA HTG 29-OCT-1999

bin (displaydbe-wormsecations) Sequence sobject=175B8A current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

Exceptions are indicated by an explicit note. Important: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

It may be shorter because we only sequence overlapping sections once, or longer because we only sequence overlapping sections once, or longer because we only sequence overlapping sections once, or longer because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryotta; Metazoa; Nematoda; Secernentea; Rhabditia; Rhabditida; Rhabditina; Rhabditoidea; Rhabditidae; Peloderinae; Caenorhabditis. /note="Vector: ml3MP19 with added BstXI site; V-type:
Phage; Genomic DNA from a single adult zebrafish of AB
strain was dispeted with Alui, CacBI, HaeIII, NlaVI, or
RsaI. Fragments in the range of 250-500 bp were gel
purified and a BstXI linker was added. The fragments were
cloned into a modified Ml3mp19 vector and transformed
into E. Coli DH5alpha. Microsatellite sequences were
screened with labeled d(CA)15 and d(GT)15 oligonucleotide

Inxton, Cambridge Libs Sequence visualished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate

Page 23; 29pp; English.

Equine dermal cells (NBL-6) were infected with EHV-4 strain 1942 viral DNA, purified and a BamHI library constructed in pUC9.

Calcium shocked E. coll pHT cells were transformed with the recombinant plasmids. Additional clones were derived from a restriction digest of pUC9 concy. The BamHI G fragment. The the gene was determined. by analysis of overlapping sequences (SEQ ID no 10. Vaccines can be prepd. using this sequence, and they may be used to protect horses against EHV-4 infection, inducing a higher level of immunity and less side-effects than other live virus vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq_documentation_block:

Wroleic acid encoding Drosophila melanogaster tipE protein - for prodn. of recombinant voltage-dependent cation channel
Example 11: Collumn 37.40: 33pp; English.

Togydy and Togyg represent the 5' and 3' untranslated regions of the Corsophila tipE protein, result in a chiyl methane sulphonate.

Mutations in the tipE protein, result in a chiyl methane sulphonate induced recessive mutation phenotype. Homologous files for the mutation paralyse rapidly at 38 degrees, and recover immediately when returned to 23 degrees. Coexpression of the full length tipE sequence, and a nucleic acid encoding a para protein results in translation products that form a functional voltage-dependent cation channel. The cation channel can be used to screen for possiticides active against insects such as Drosophila melanogaster and pest insects. The cation channel can also be used to screen for drugs for use in the treatment and prevention of parasitic infections in humans and animals, and to screen drugs for their neuroprotective effect against hypoxia, stroke, and head trauma.

Example 27.001 and 27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T59978;

New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and the many of T. pallidum infections, particularly syphilis (21aim 1) Page 368-370; 1150pp; English.

X25500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detection disease; related to Borrelia infections in animals, and for the production of blosynthetic products such as enzymes.

Screening for agents which modulate ion channel function - using host cells transformed with nucleic acids encoding the Drosophila melanogaster tipE and para proteins
Disclosure: Column 37-40; 54pp; English.

Disclosure: Column 37-40; 54pp; English.

Disclosure: Column 37-40; 54pp; English.

This sequence repersents the 3'-qry from a Drosophila melanogaster tipE+
protein which is used in a method for screening for agents which modulate
for channel function which uses host cells transformed with nucleic acid
encoding Drosophila melanogaster tipE and para proteins co-expression of
these genes in the host cell, allows the formation of a functional
voltage dependent cation channel (VDCC) in the cell. The agents
identified can be used as pesticides for the control of Drosophila
melanogaster or other insects. They can also be used to screen
hypoxia, ischemma, stroke and head trauma.

                                                                                                                             head trauma.
                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                    prosopila tipe protein. Mutations in the tipe protein, result in a brosopila tipe protein. Mutations in the tipe protein, result in a bethyl methane sulphonate-induced recessive mutation phenotype. Homologous flies for the mutation paralyse rapidly at 38 degrees, and recover immediately when returned to 23 degrees. Coexpression of this sequence, and a nucleic acid encoding a para protein results in translation products that form a functional voltage-dependent cation channel. The cation channel can be used to screen for pesticides active against insects such as Drosophila melanogaster and pest insects. The cation channel can also be used to screen for drugs for use in the treatment and prevention of parasitic infections in humans and animals, and to screen drugs for their neuroprotective effect against hypoxia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21-APR-1999 (first entry)

Claim 1: Page 256; 577pp: English.

X51787 to X52019 represent 5' expressed sequence tags (ESTS) for human secreted proteins, and encode the proteins given in Y12987 to Y13219, crespectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopolesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemokinetic activity, haemostatic and thrombolytic activity, receptor/ ligand activity, tumour inhibition activity and chromoseme mapping procedures. The sequences can also be used for and chromosome mapping procedures. The sequences can also be used for
Disclosure; Fig 7A-B; 54pp; English.

This sequence encodes a Drosophila melanogaster tipE+ protein which is used in a method for screening for agents which modulate ion channel function which uses host cells transformed with nucleic acid encoding brosophila melanogaster tipE and para proteins. Co-expression of these genes in the host cell, allows the formation of a functional voltage dependent cation channel (VDCC) in the cell. The agents identified can be used as pesticides for the control of Drosophila melanogaster or other insects. They can also be used to screen pharmaceutical agents for their neuroprotective affect against e.g. hypoxia, ischaemia, stroke and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human secreted protein 5' EST SEQ ID NO: 109.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. 58 G; 67 T; sequence 278 BP; 95 A; 56 C; 58 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            products

                                                                                                                                                                                                                                                                                                               exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exon
                                                             This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S. aureus DNA sequences allows putative functions to be assigned so that prictein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are industrial importance can be obtained. Specifically, sequences which are be used in a vaccine composition against S.aureus infection. The be used in a vaccine composition against S.aureus infection. The complexity to be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating computer; readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                           Staphylicoccus aureus contig SEO ID #4228.

DNA encoding 1-amino:cyclo:propyl-1-carboxylic acid synthase of Brassica oleracea - used to regulate ethylene-dependent processes in plants, esp. to improve shelf life

Train 2: Figla.B: to prove shelf life
Claim 2: Figla.B: 50pp; English.

Brassica oleracea genomic clone ACCAl (733136) codes for 1-aminocyclopropyl-1-carboxylic acid synthase (ACC-synthase)
CR98598), an enzyme involved in ethylene blosynthesis. It was cold. by subjecting broccoli leaf total genomic DNA to PCR using primers (see also T33137-38) based on the Arabidopsis thaliana ACC synthase gene. The product was cloned into PCRII to obtain clone continues or antisense orientation, into an expression cassette and then transferred to a binary vector suitable for Agrobacterium-mediated plant transformation. The constructs permit control of the level of CRC synthase in a transgenic plant (esp. B. oleracea or cucumis melo) and hence a control of maturation, ageing and shelf-life. We of oligo:nuclectide primers and probes - for detection, identification and quantification of bacteria, fungi and bacterial antibiotic resistance gene(s)
antibiotic resistance gene(s)
Claim 19; Page 108: 167pp; English.
The present sequence represents an antibiotic resistance gene blaz
fresistant to beta-lactams), and was used to design PCR primers
V37050-51. The specification describes the use of probes and/or amplification primers which are specific, ubiquitous and sensitive for determining the presence and amount of nucleic acids from a bacterial antibiotic resistance gene and specific bacterial and fungal species in any sample suspected of containing the bacterial or fungal nucleic acids where each of the nucleic acid or variant or part comprises a selected target region hybridisable with the probes or primers. The method of
                                                                                                                                                                                                                                                                                                     The AMAY 1995; UOR 108 208.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable conditum, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, oxicomyelitis, syndrome, etc. Organisms transforamed with the DNA sequences can be used to the polypeptides. The now DNA sequences can be used to the polypeptides. The now DNA sequences can be used to the polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Staphylococcus aureus contig SEQ ID #858.
Computer readable meds contig SEQ ID #858.
cellulitis; eyelld infection; food poisoning; osteomyelitis; therapy; skin infection; surgical wound infection; scalded skin syndrome; toxic shock syndrome; ds.
Staphylococcus aureus.
EP-786519-A2.
use comprises contacting the sample with the probes or primers and detecting the presence of hybridised probes or amplified products as an indication of the presence of the specific bacterial or fungal species and bacterial antibiotic resistance genes. The methods and products can be used to detect and identify the bacterial and fungal species. Agenera and determine the bacterial resistance to antibiotics. Bacillus thuringiensis var israelansis cry D toxin gene and proteins
- used for producing insecticide compsns.active against Dipteran species.
Claim 1; fig 2; 58pp; English.
cryb gene is inserted into plasmid and used to transform a microorganism.
                                                                                                                                                                                                                                                                                                                                                                                                                                             P-PSDB; R97735.

Wew DNA construct for expressing cryIV D protein in cyanobacteria under control of a phycocyanin beta promoter, useful for control of a thycocyanin beta promoter, useful for control of a dipteran larvae in water under control of a phycocyanin beta promoter, useful for control of a dipteran larvae in water models the B. thuringiensis ssp. israelensis cryIVD toxic protein, which was used in the prep. of a claimed DNA construct for the expression of CryIVD in cyanobacteria, comprising the present sequence under the control of phycocyanin beta (cpcB) promoter. Cyanobacteria (which may be adapted for growth in fresh to promoter. Cyanobacteria (which may be adapted for growth in fresh cas insecticides for controlling dipteran larvae, esp. those of as insecticides for controlling dipteran larvae, esp. those of consquitoes and blackfiles, that live in water. The percentage of collex pipens (mosquito) larvae surviving after 4 days with cyanobacteria transformed with the claimed DNA construct as their only food source was 51 %, compared to 94 % for those fed with cyanobacteria, CryIVD is efficiently expressed under the control of the strong cpcB promoter, even though the CryIVD gene contains 19 contains 19 may their and the changereria in the strong cpcB promoter, even though the CryIVD gene contains 19 contains 19 contains 19 in contains 19 contains 10 con

The present sequence encodes a protein disulphide isomerase (PDI) derived form a methylotrophic yeast, Candida boldinii strain S2. PDI is a major protein present in the lumen of the endoplasmic reticulum. PDI is a major protein protein must stay in the national proteins of secretory proteins. As the protein must stay in the endoplasmic reticulum, it has a sequence known as the endoplasmic reticulum retention signal sequence at the carboxy terminus (W56317). The PDI protein is useful in gene therapy and genetic engineering. The PDI gene may be coexpressed with a gene of interest to ensure the production of a correctly folded biologically active protein.

parts from stage 10.5 and stage 11.5 gastrulae).
ECORI-XhOI cut CDNA was then ligated into UniZap-XR
(Stratagene) with ECORI at the 5' end and XhOI at the 3'
end. SS-library phagemids were prepared by mass excision
from the original library and normalized by hybridization
to biotinylated driver (prepared from the same library by
PCR) to Cot-omega of 11. After removal of hybrids and
excess driver by streptavidin sepharose chromatography,
the ss-phagemids were made double stranded and
electroporated into Top-10 F'. Original library
contruction by Bruce Blumberg (Cho et al. 1991 Cell 67,
1111-1120). Normalized by Jihwan Song (Song, Cho and

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC acceptance by a recipient of a transplant from an MHC unmatched of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     R83096;

Claim 10: Page 36: 41pp: English.
The present sequence is an immunomodulatory peptide, which
The present sequence is an immunomodulatory peptide, which
Comprises a Class I HLA-B alpha-1 domain sequence. It can be used
in a pharmaceutical composition together with a subtherapeutic dose
of an immunosuppressant, to extend the period of acceptance of a
transplant from a major histocompatibility complex (MHC) unmatched
donor, i.e. to inhibit transplant rejection. It can also be used in
the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             19-JUN-1998 (first entry)
Peptide B2702.75-84LB1 tested for immunomodulating activity.
Immunomodulating dimer; immunosuppressant drug; CTL activation; transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                  Length 10;
                                                                                                                                                                                                                                                                                                Peptides using the D-form amino acids are more effective immunomodulators than their diastereomers or enantiomers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Wey peptide(s) based on class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets claim 1; Page 34; flpp; English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide sequence is more commonly found within larger peptide compounds of not more than 30 amino acids in length.
                                                                                                                                                                                                                                                                                                                                                                                                   15-MAR-1994 (first entry)
peptide fragment of Class I HLA peptide.

This sequence represents the alphal-helix of the human-leucocyte-associated antigen B2702 (HLA-B2702). This sequence, epitopes, and palindromes of it (such as R95428) can be used to isolate the protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein associated with T-cell lysate. P74 is a T-cells, and is a limited number of cell types, but is particularly expressed on B and T cells. P74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity expressed on B and T cells. P74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity compositions comprising the extracellular fragment of P74 combined with HA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compositions comprising the extracellular fragment of P74 combined with HA-B2702.by combining the amount of binding between the candidate compound and P74. T-cells, by combining them with the extracellular portion of P74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of P74, in an amount sufficient to compete containing the binding of the P74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HLA-82702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           12.NOV-1996 (first entry)

                                                                                 Treatment of auto-immune disease by admin. of peptide(s) corresp. to major histocompatibility complex antigens - esp. for delaying onset of cilifical symptoms of insulin dependent diabetes by modulating T cell madiated attack on target cells

Treatment of the constant of the cells claim 7: Page 20; 24pp; English.

W07512-W07518 represent T-cell modulating peptides that can be used in the method of the invention. These sequences are based on a portion of the major histocompatability complex (MFO) class I antigen (see W07510). The method is for affecting the course of an autoimmune disease involving T-cell mediated destruction of tissue in mammals. These peptides are used especially to treat insulin-dependent diabetes mellitus, preferably being administered during the pre-clinical stage to delay onset of the disease. Other diseases that can be treated are multius, preferably being administered during the pre-clinical stage to delay onset of the disease. Other diseases that can be treated are multius, at disease, thyroid disease, Hashimoto's thyroiditis, myasthenia gravis, etc. The peptides modulate T-cell mediated attack on autologous transfer cells, and may also reduce inflammation, swelling, and release of cytokines, perforins, granzymes etc. associated with T cell activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treatment of auto-immune disease by admin. of peptide(s) corresp. to major histocompatibility complex antigens - esp. for delaying onset of clinical symptoms of insulin dependent diabetes by modulating T coll mediated attack on target cells.

The present sequence is an immunomodulatory peptide, which comprises a Class I HiA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.

Peptides using the D-form anno acids are more effective immunomodulators than their disastereomers or enantiomers.

Example 1: Page 19: 41pp: English.

Peptides Wa374-98 and Wa3778-9 were assayed for their immunomodulating cerivity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or crivity.

Crieminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula: A-B, where A, B = (Crieminal amidated comprises the formula: A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B alphal domain (positions or a class of a complex comprises and combination with antiqenic peptides or proteins of interest to activate CTLS. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treathing autoimmune diseases, e.g. diabetee, rheumatoid arthritis and lupus srythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                   transplant rejection
Claim 10: Page 36: 41pp; English.
The present sequence is an immunomodulatory peptide, which
The present sequence is an immunomodulatory peptide, which
Comprises a Class I HLAH a lipha-1 domain sequence. It can be used
in a pharmaceutical composition together with a subtherapeutic dose
of an immunosuppressant, to extend the period of acceptance of a
transplant from a major histocompatibility complex (MHC) unmatched
donor, i.e. to inhibit transplant rejection. It can also be used in
the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                19-JUN-1998 (first entry)

Peptide Ba702.75-84 tested for immunomodulating activity.

Immunomodulating dimer: immunosuppressant drug; CTL activation; transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or

EXAMPLE 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R9297-R92913 represent fragments of class I major histocompetability complex (MHC) antigens. This sequence corresponds to residues 70-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of The peptides are administered to a patient from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                   16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.70-84).
HLA-B2702 CTL modulating peptide (B2702.70-84).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75.84 of the alpha-1 domain of the class I MHC HLA B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) Sequence 20 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HLA-B2702 CTL modulating peptide (82702.84-75/75-84).
Yytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC, immunosuppressant; graft versus host disorder; transplantation; the class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claims (Carrell Manuer) (Carrell Manuer) (Carrell Manuer) 95-358582/46.

Extension of acceptance period of transplants from MHC unmatched Annor hosts - using Class I B75-84 MHC antigen of the recipient
New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ouery Match 89.8%; Score 44; DB 1; Length 15; Best Local Similarity 90.0%; Pred.
